

Figure 1: Number of samples that had each descriptor feature. A descriptor is counted as present for a sample if it was indicated as present in any grid by any reviewer. Dotted lines separate descriptors into 8 domains: Renal Tubular Atrophy, Tubular Cell Injury (other than atrophy), Tubulitis, Abnormal Tubular Luminal Morphology, Intratubular Casts, Tubular basement membrane Morphology, Extracellular matrix, Inflammation (from the bottom).

Figure 2: Estimated ICC of individual descriptor scores with 95% CI. Marked NA when the features were never present in any of 9 samples.

Figure 3: Estimated ICC of individual descriptor scores with 95% CI. Marked NA when the features were never present in any of 9 samples. (Part 1)

Figure 4: Estimated ICC of individual descriptor scores with 95% CI. Marked NA when the features were never present in any of 9 samples. (Part 2)

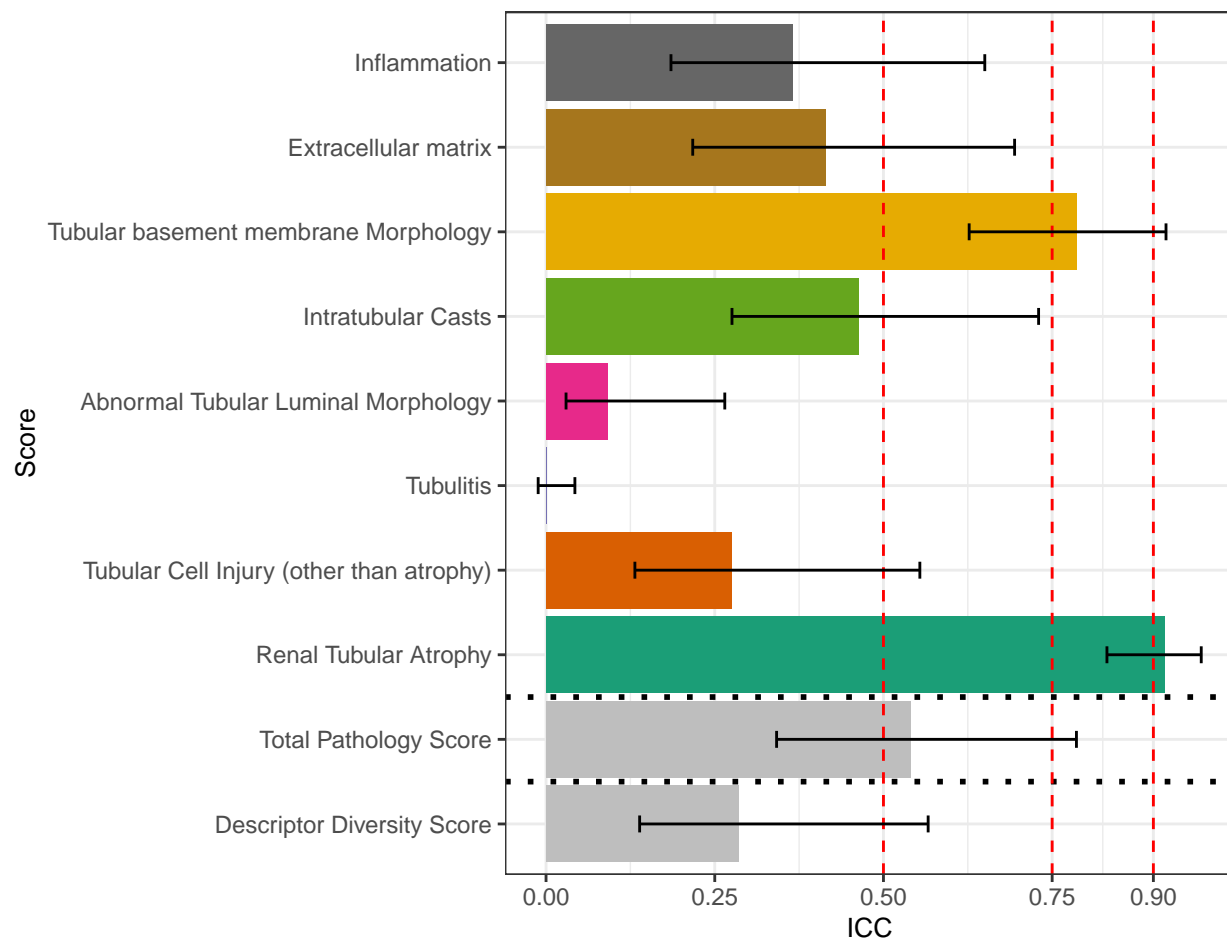

Figure 5: Estimated ICC of total pathology, domain specific, and descriptor diversity scores with 95% CI.

Figure 6: Estimated ICC of individual descriptor scoring of presence/absence at the grid level. Marked NA when the features were never present in any of 9 samples.

Figure 7: Heat map of co-occurrence. Co-occurrence is counted for a sample if two paired features were indicated as present in any grid by any reviewer. The highest frequency co-occurrences are marked dark blue and the lowest frequencies are white. Descriptors with red color were those never indicated as present in any grid by any reviewer.

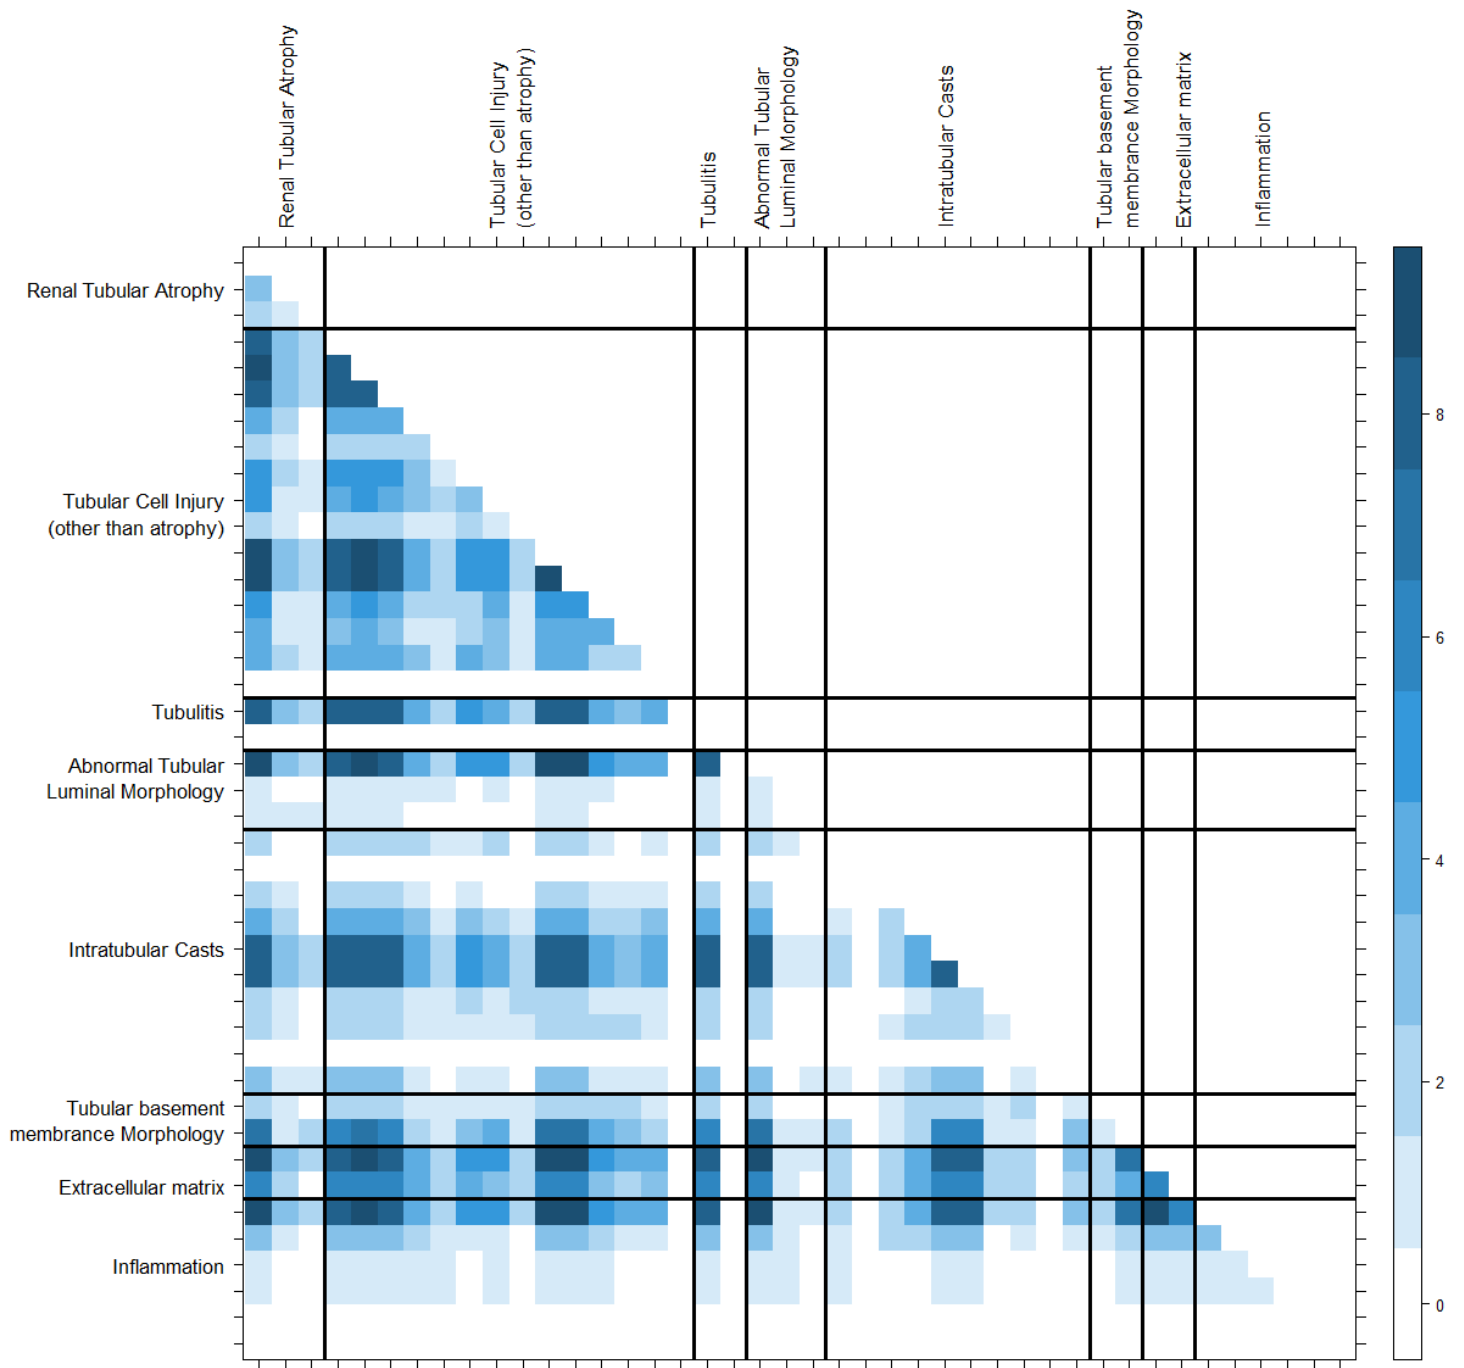

Figure 8: Heat map of co-occurrence with domain name and color code
